

Python and Data Analysis Basics

Exploratory Data Analysis of New York Housing Prices

1. Dataset Overview:

This dataset contains information about houses in New York, including property prices, number of bedrooms and bathrooms, property size, house type, location, and geographical coordinates. The dataset was used to explore patterns and relationships in New York's housing market.

2. Key Findings:

The median property price was \$825,000, while the mean price was approximately \$1.91 million.

The difference between the mean and median indicates the presence of very high-priced properties.

The average property had approximately 3 bedrooms and 2.4 bathrooms.

The average property size was approximately 1,931 square feet.

Property prices showed a relationship with property size, although several extreme values were present.

Property prices varied across property types, bedrooms, and bathrooms.

Brooklyn, New York, and Queens had high numbers of properties in the dataset.

3. Conclusion:

The analysis provided useful insights into New York housing prices. The visualizations showed differences in prices based on property characteristics and location. Overall, Python, Pandas, Matplotlib, and Seaborn were useful for cleaning, analyzing, and visualizing the housing dataset.
